#***Strings*** :

"String is a Data type in python."

- String is a sequence of characters enclosed in quotes.
- We can primarily write a string in these three ways.

Example:

a = 'harry' #single quoted string.
b = "harry" #double quoted string.
c = ""harry"" #triple quoted string.

#***String Slicing:***

- A string in python can be sliced for getting a part of the strings.

Consider the following string *:*

Name = "H a r r y"

0 1 2 3 4

(-5) (-4) (-3) (-2) (-1)

*(Length = 5)

- *the index in a string starts from 0 to (length -1) in python.*
- *In order to slice a string, we use the following syntax.*

Sl = Name(ind_start : ind_end)

Sl[0:3] returns "har"------- characters from 0 to 3
Sl[1:3] returns "ar" ------- characters from 1 to 3

#***Slicing with skip value*** **:**

- *We can provide a skip value as a part of our slice like this :*

Word = “amazing”

Word = [:7**]** #*word*[0:7] — ‘amazing’
Word = [o:] #*word*[0:7] — ‘amazing
