#Python.py

Chapter 01. Variable and Data type

* A variable is the name give to a memory location in a program for example.

a = 30 #variable = Container to store a value.

b = "harry" #keywords = reserved words in python.

c = 71.22 #indentifiers = class/function/variable name.

Data Type:

*Primarity these are the following data types in python.

1.) **Integers**
2.) **Floating point numbers**
3.) **String**
4.) **Boolean**
5.) **None**

*Python is a fantastic language that automatically identifies the type of Data for us.

Example:

```
a = 71  #int.
b = 88.44  #float.
name = "harry"  #str.
```

#**Rules for defining a variable name**(also applies to other identifiers)

- A variable name can contain alphabets, Digits and underscores.

- A variable name can only start with an alphabets and underscores.

- A variable name can't start with a Digits.

- No while space is allowed to be used inside a variable name.

Example of a few variable names are :

harry, one8, seven, _seven etc.

Operators in python :

Following are some common operators in python.

01.) **Arithmetic operators :** +, -, ×, / etc.
02.) **Assignment operators :** =, +=, -= etc.
03.) **Comparison operators :** ==, |>=, <, != etc.
04.) **Logical operators :** and or not.
